Breathing Life into Information Literacy Skills: Results of a Faculty-Librarian Collaboration

Abstract
When an education professor and a reference librarian sought to improve the quality of undergraduate student research, their partnership led to a new focus on assessing the research process in addition to the product. In this study, we reflect on our collaborative experience introducing information literacy as the foundation for undergraduate teacher education research. We examine the outcomes of this collaboration, focusing on the assessment of the process. Using a mixed methods approach, we found that direct instruction supporting effective research strategies positively impacted student projects. Our data also suggest that undergraduate students benefit from not only sound research strategies, but also organization strategies.

Keywords
information literacy, undergraduate research strategies, library instruction, teacher education, direct instruction, organization strategies, student reflections

Abstract

When an education professor and a reference librarian sought to improve the quality of undergraduate student research, their partnership led to a new focus on assessing the research process in addition to the product. In this study, we reflect on our collaborative experience introducing information literacy as the foundation for undergraduate teacher education research. We examine the outcomes of this collaboration, focusing on the assessment of the process. Using a mixed methods approach, we found that direct instruction supporting effective research strategies positively impacted student projects. Our data also suggest that undergraduate students benefit from not only sound research strategies, but also organization strategies.

Keywords: information literacy; undergraduate research strategies; library instruction; teacher education; direct instruction; organization strategies; student reflections.
**Introduction**

Today’s students face a variety of new factors impacting the quality of the information to which they are exposed. This study examines how a new collaboration between a professor and librarian impacted students’ information literacy skills in a 300-level course. (This 300-level course includes an expectation of deep synthesis in order for students to apply education theory to practice through a pedagogical lens.) Project Information Literacy (PIL) research reveals that young adults feel overwhelmed by the amount of information available to them, and that they struggle especially with the beginning stages of reviewing literature. Almost all young adults return to familiar, ‘tried and true’ information sources and information seeking strategies without tailoring their approach to address a particular information need (Head and Eisenberg, 2009a, 2009b, 2010a, 2010b, 2011). Consequently, undergraduate students do not always find research assignments to be the invigorating investigations that faculty intends them to be, and their performance suffers. The Association of College and Research Libraries (ACRL) defines information literacy as:

> a set of abilities requiring individuals to recognize when information is needed and have the ability to locate, evaluate, and use effectively the needed information. (ACRL, 2015).

Focusing on improving student information literacy can positively impact literature review quality and, as a result, overall student learning at the undergraduate level.

Since global information is available by just a click at the computer, our information landscape is quite dynamic and has prompted changes in student learning goals. Consequently, our undergraduate pedagogical methods must also change if we are to continue to support innovative, reflective thinkers within and beyond a liberal arts community where student and faculty research blend (Trilling and Fadel, 2012; Jastram et al., 2011). According to ‘Project Information Literacy’, information literacy skills greatly impact the success of our current undergraduates as well as their ability to succeed following graduation (Head and Eisenberg 2012). If course assignments, projects, and readings are designed to help students improve their information literacy, our graduates will have a more successful opportunity to re-engage in the digital society within their postgraduate workforce with these newfound skills, including but not limited to initiating research; analyzing information and synthesizing information in order to develop
innovative ideas to share within their field and beyond (Wolf, 2008; Small and Vorgan, 2009; and Scharf et al., 2007). Research shows that integration of information literacy within an authentic context appropriately challenges students to think and reflect in order to shape and explain their world (Oakleaf, 2009; Trilling and Fadel, 2012); undergraduate coursework serves as a platform for each of us to provide students with such an intellectual challenge. However, current pedagogical practices do not always ensure that students reflectively meet this challenge effectively or efficiently.

Information professionals assert that students who are asked to explain the thought process behind their researching skills and who are assessed on that process are more likely to create original work (Gilchrist and Oakleaf, 2012), yet there are few studies that have explored library research as a process rather than a product. The present study analysed one 300-level teacher education course as the students prepared for two separate assignments; a 75-minute interactive oral presentation and a poster to be presented to various community stakeholders. This paper will discuss the importance of being reflective consumers of information in order to be effective practitioners in the field. We will also report the results from an examination of our students’ literature review strategies. For the purposes of this paper, our initial research focused on one overarching research question, ‘what were the outcomes of collaborative efforts between a reference librarian and undergraduate professor to build a strong foundation of research skills for pre-service teachers?’ We also asked two related sub-questions:

1. How did the information seeking process develop over time?
2. How did students’ information seeking practices change over time?

While our initial questions focused on students researching, our later reflections also prompted us to consider elements of our collaboration, such as the design of our teaching environment and how we hoped to impact student learning.

**Framing a research process inquiry**

We used Cochran-Smith and Lytle’s notion of an inquiry stance (Cochran-Smith and Lytle, 1993, 1999a, 2009) as an organizing theoretical and pedagogical framework. In this approach, teachers are empowered to work together to co-construct knowledge-of-practice
and serve as agents of change in their classrooms. Action research, or systematic inquiry into problems of practice, serves as the primary tool for guiding teachers toward ownership of knowledge and skills for critical reflection (Dana and Yendol-Hoppey, 2009; Mills, 2010). Action research has been highlighted across the literature as a powerful teacher education practice (Grossman, 2005), noted for its ability to illustrate candidate’s understandings about teaching and learning (Darling-Hammond, 2006), foster social justice (Zeichner, 2009), and facilitate professional growth (Ball and Cohen, 1999).

Self-studies of action research abound in the teacher education literature and typically examine its affordances and constraints in context. Some prominent examples of self-studies have explored the outcomes of action research on teacher educators, teachers, and pre-service teachers’ learning (Cochran-Smith et al., 2009), teacher reflexivity et al., 2010), and personal and institutional development (Valli, 2000; Valli and Price, 2005). Additional analyses look at action research as a tool for fostering emancipatory practice (Gore and Zeichner, 1991) and the process of thinking like a researcher (Christenson et al., 2002).

**Mode of Inquiry**

One 300-level teacher education class with a total of twelve students participated in this project. The students’ information seeking skills were analyzed at the beginning of the study and again at the end of the study using a rubric (Figure 1). The researchers for this study included the professor who taught the course, a reference librarian, and two education students. Prior to the project, the reference librarian and the professor discussed how the project would be structured and executed, in hopes of avoiding the poor assignment quality seen in previous semesters. The two began with a discussion of the final project and how this project focused on assessing a product, a review of literature, rather than the process of researching. Realizing that a better research process would lead to a better literature review, the two agreed that a closer examination of how students actually conduct research was in order. They asked the students to create fifteen-minute recordings of their current research practices using an online tool, ‘Screencast-O-Matic’; this tool captures the audio and screen movements employed by the user and was chosen because it is free, web-based, and platform neutral (see http://www.screencast-o-matic.com ). Students used a ‘think-aloud’ process to share their thoughts as they made
decisions during their individual online review of literature. This initial video log (recorded between the first and second day of classes) served as a baseline (see Appendix 1).

Our first intervention took place on the second-class day, just after the students created their first video research logs. The reference librarian led the class through a series of active learning exercises designed to improve their search skills. Students began by reporting on their typical information gathering tools and strategies; these were used to create a collective concept map of research tips. The librarian then introduced a database of reference books to use for background information. Next, students explored various disciplinary databases in pairs and shared with the entire class. The concept map was referenced during the reports to reinforce the use of various tools and highlight their context within a universe of research options. This class session was intended to give the students a stronger foundation for their individual research skills than they would have had otherwise.

The next intervention occurred when the students were in the midst of their individual research. Students were asked to schedule individual appointments with the librarian about a week before their in-class presentations. Students were to bring the sources they had found so far, as well as questions regarding sources they still had not found. The librarian used the research process rubric (Figure 1) during this conference in order to provide feedback to the students about their research skills. Eight out of the twelve students participated in this conference.

Using quality sources, students were able to create innovative, interactive, and informative lessons. Classmates eagerly took notes on the shared information. After students shared their findings via an engaging lesson, the instructor evaluated it with a rubric and provided constructive feedback regarding both content and delivery. The instructor concluded that there was improvement in presentation content compared to previous semesters' work.

Students then began finding information for their poster presentations. They were asked to create another fifteen-minute video research diary for the researchers to examine later. The poster assignment was designed to hone existing research skills, further extend the students’ application of research skills, and provide a platform to share the results of their literature review in a public forum. The posters were shared with various community
stakeholders at the end of the semester, and the instructor evaluated these literature review posters with a rubric.

Data Sources

In action research studies, data collection is a result of systematic and intentional study of one’s own practice with the goal of improving that practice (Dana and Yendol-Hoppey, 2009). A related methodological goal of the present inquiry was to base documentation upon evidence taken from the daily life within the college classroom (the in-class instructional sessions and poster presentations) and beyond it (the video research diaries). Different types of data collection techniques were used throughout the course of this study, so that the multiple data sources could be used to validate the findings (Maxwell, 2013). The different methods of data collection identified possible findings for the three research questions discussed in this paper. The instruments included (a) transcriptions of both sets of video research diaries; (b) instructor’s notes; (c) librarian’s lessons; (d) librarian’s conference notes and (e) completed projects (instructional session and posters).

Results

Our initial analysis suggested that this new focus on improving information seeking strategies helped students improve their overall information literacy and class performance. The baseline video research logs collected at the beginning of the semester showed that students relied most heavily on various search engines (such as Google) to limit and prioritize search results. Consequently, some of the research results did not include the most appropriate sources to be included in an instructional session. Students did not select the best sources because they had not used the most appropriate tools to find their sources, such as disciplinary databases and streaming video databases from the library. Analysis of the second batch of video research logs (collected near the end of the semester) showed new use of scholarly information-seeking tools such as ERIC (http://eric.ed.gov/); the library catalogue and the library discovery platform. Video clips were more likely to come from published documentaries rather than YouTube. The researchers were pleased that the new interventions had a positive impact on student
performance. Next, they turned attention to the new research process rubric, hoping to better codify desired student research behaviors.

Recall that the librarian and instructor constructed a rubric to capture the literature review process prior to the start of the semester (Figure 1). As we used this rubric to evaluate student information-seeking skills we soon realized that it did not measure the process as well as we had hoped. The librarian, instructor, and student researchers discussed and revised the rubric as well as the implementation of the rubric, and used the new version to score the video logs (Figure 2). The revised rubric can now be used as more than a formative assessment tool – it can be shared with incoming students as an instructional tool. The instructor and librarian can use the rubric when planning future lessons. We anticipate that the improved rubric will lead to improved learning to be generated from future students, rather than a summary evaluation of what had been learned.

We began the semester hoping to support students’ learning by assessing their information seeking process – and we did. By establishing a collaborative practice of inquiry within our classrooms, we also improved our own teaching of the information seeking process. Here is an example of how this collaborative inquiry generated pedagogic change. Because the video research logs recorded authentic student information seeking behaviors, we were able to identify a critical skill gap we had not noticed before: students still need help organizing their found information. The videos showed that most students utilized haphazard techniques to save or organize the results of their review of literature, and many attempts failed. Only one of the students implemented a systematic method for securing citations, downloading copies of texts, and saving secure web links (we later determined that the student had unusually high research skills thanks in part to a Mellon Summer Scholar fellowship). The researchers found it very disheartening that so many students relied on the first few pages of results from one search engine and that so many students failed to successfully save the sources they intended to. In response to this finding, we introduced an additional instruction period devoted to information organization during the next semester in which the course was taught. The librarian covered topics like saving source citations, formatting citations, downloading articles, and using databases to make the organization process more efficient, and the instructor provided further support and accountability in order to positively influence student information seeking habits.
We made a few more changes in the fall 2012 class design, as well. We decided to show some of the spring 2012 videos during the library visit, particularly ones that demonstrate how a student may organize ideas during a review of literature. We made the literature review process rubric more ‘public’ by sharing it in the fall 2012 syllabus. Finally, we allowed students to make individual appointments with any reference librarian, not just the one who conducted the research instruction sessions with the entire class.

**Scholarly significance of the study**

The findings of this research support the theoretical rationale presented earlier in this paper. The suggested implications for teaching, while being grounded in the inquiry framework, drew from the theorists that influenced the current study. The present study highlights the complexity of literature review implications that are found in teacher education undergraduate courses. Each semester, instructors inherit a group of multidisciplinary students with very different and numerous information seeking experiences that influence how they gather information. It is thus important for educators to provide venues in order to share their newly found knowledge and experiences. As instructors it is our professional commitment to work toward creating such experiences for each of our students.

Although educational institutions and instructors:

> talk about and teach separate interpretive activities... [such as reading, viewing, listening, speaking, thinking, and writing; our students] ..actually live in whole cultures and bring insights from one medium into their approach to another. (Mackey, 2002, p. 50).

It is very difficult to teach students to try a new research method until you show them that their “tried and true” methods often limit and / or negatively impact their results (Head and Eisenberg, 2009b). Today's students:

> actually read within the framework of a sophisticated context that includes numerous forms of media, multimedia, and cross-media engagement. (Mackey, 2002, p. 51).

Against such backdrops, this study generated six implications for teaching that will be of relevance to future research: (a) use of rubrics to guide the process and instruction of literature reviews, (b) teaching information-seeking skills prior to and during authentic projects, (c) bringing multidisciplinary experiences and knowledge to the review of literature, (d) transferring information seeking skills to other contexts, (e) teaching students how to organize gathered information, and (f) orally sharing thinking and reasoning while
reviewing literature to publicize the private research techniques of individuals for the benefit of other students.

**Next Steps**

In action research studies, data collection is a result of systematic and intentional study of one’s own practice with the goal of improving that practice (Dana and Yendol-Hoppey, 2009). A related methodological goal of the present inquiry was to base documentation upon evidence taken from the daily life within the college classroom (the in-class instructional sessions and poster presentations) and beyond it (the video research diaries). Different types of data collection techniques were used throughout the course of this study, so that the multiple data sources could be used to validate the findings (Maxwell, 2013). The different methods of data collection identified possible findings for the three research questions discussed in this paper. The instruments included (a) transcriptions of both sets of video research diaries, (b) instructor’s notes, (c) librarian’s lessons, (d) librarian’s conference notes, and (e) completed projects (instructional session and posters).

**Author Details**

**Divonna M. Stebick** has an academic background in teacher preparation, literacy, and special education and is an Associate Professor in the Education Department at Gettysburg College, Gettysburg, Pennsylvania. Divonna’s research interests extend beyond information literacy to include effective learning practices for all learners. She also pursues research in the implications of digital literacy, comprehension and teacher preparation.

**Janelle Wetzberger** is Director of Reference & Instruction at Gettysburg College’s Musselman Library, where she supports the research of undergraduate students and faculty and participates in an active information literacy instruction program. She manages the institutional repository, The Cupola: Scholarship at Gettysburg College, and
coordinates campus outreach and education regarding open access. She is also involved in the design and implementation of library programs and learning series which support the curriculum, encourage critical thinking, and enliven the imagination.

Margaret Flora has an academic background in Mathematics and Secondary Education and is currently a high school mathematics teacher at West Holmes High School in Ohio. As a high school teacher, she maintains a working knowledge of new philosophies and practices in education and tries to incorporate these into her daily teaching.

Joseph Miller has an academic background in sociology and elementary education. Currently, he coordinates the math curriculum for sixth grade at KIPP Philadelphia Charter school, where he teaches all subjects in his self-contained classroom. Some of Joe's other research interests are the impact of gender in K-12 school settings and the perceived meritocracy of high-stakes standardized tests.
Appendix I

Creating a Video Research Diary

You will use Screencast-O-Matic to create a 15-minute video research diary. The diary will include screen capture and an audiorecording of your voice. Please verbalize your thoughts as you do your research – understanding why you do what you do will help us!

What is Screencast-O-Matic?

- See http://www.screencast-o-matic.com/
- Online screen recorder
- One-click recording from your browser on Windows, Mac, or Linux
- No install, no account registration or setup
- FREE

Before you begin

- Make sure you know how to access your H: drive. This is a network drive that stores up to 750 MB (you’ll need about 75 MB of free space to complete this assignment). When you log in to lab machines on campus, you automatically see your H: drive. If you haven’t already mapped your H: drive to your personal computer, see the instructions provided by IT at http://www.gettysburg.edu/about/offices/it/io/cs/tech/accessing_your_h_drive.dot.
- Make sure your Java is working and updated (you need Java 1.5 or later). http://java.com/en/download/testjava.jsp
- Make sure you have a microphone. (If you are using your laptop, you probably have one built in. If you are using a desktop machine without a microphone, you may borrow one at the library. Ask at the circulation desk.)
- Make sure you have a thumb drive with about 75 MB of free space. (If you don’t have a thumb drive handy, you may purchase one in the office supply vending machine on the library’s main floor.)
- If prompted, you need to allow the java plugin.
- Watch the quick demo online: http://www.screencast-o-matic.com/watch/cXhbbqb9C
• Make a very short test video to make sure you can capture both your screencast AND your voice. One tester recording at a computer lab had to change a setting so the computer recognized the microphone – so don’t skip the test step! Make sure you are capturing as much of your screen as possible – but I suggest leaving a small space at the bottom so that the S-O-M controls don’t obscure your taskbar. The S-O-M control box isn’t resizeable.

• Then proceed with your assignment.

Your assignment: Record a 15-minute video research diary

• Spend ONLY 15 minutes beginning to research and find materials for your presentation (see syllabus for details about this assignment). Record the FIRST 15 minutes you spend on this project. There are no right or wrong answers. We want an honest peek at how you begin to tackle a research assignment.

• Remember that if you need to PAUSE your recording, use ALT-P (though I had best results when I never paused).

• When you are done:
  o Choose the SAVE TO VIDEO FILE option. (You needn’t preview the video – it will take time and you’re not going to revise it anyway!)
  o Save as Quicktime (MP4).
  o Name your file researchlog1stebick (but use your own last name, not mine!).
  o Save it to your H: drive. This will take a few minutes – be patient. My 15-minute video file is 62.1 MB in size.
  o Then copy the file to a thumb drive and bring this to class to “turn it in.” Files will be transferred to the education department’s network drive. Your video will not be publicly available.

• You must complete your video research diary before class on 8/30/2013.
  Bring your thumb drive to class on 8/30.
